                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC protein, of the invention. Coding sequences for Bok or BH31 variants of CC protein, of the invention. Coding sequences for Bok or BH31 variants of CC protein, of the invention can be introduced into cell populations of the proteins in order to induce apoptosis in CC the cell population. This is useful for treatment of diseases where there CC is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok CC protein can be used to elucidate apoptosis mechanisms in reproductive and cother tissues, and provide a means for manipulating apoptosis. The Bok CC protein and transgenic animal are also useful for identifying ligands or cubstrates. Modulation of the gene activity in vivo is useful for cubstrates. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein cut with wide tissue distribution and heterodimerisation properties of facilitates elucidation of apoptosis mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive another tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
Sequence
                                                                                                                                                                                                                                                                                                                                       to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where ther is hyperproliferation of reproductive tissue, e.g. uterine, testicular
                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH3i variants of pro-apoptotic Bok-related protein can be introduced into cell populations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1999-327356/27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC This sequence is a mammalian Bok (BCl-2-related ovarian killer)
CC protein, of the invention. Coding sequences for Bok or BH3i variants of protein can be introduced into cell populations to upregulate expression of the protein can be introduced into cell populations CC to upregulate expression of the proteins in order to induce apoptosis in CC the cell population. This is useful for treatment of diseases where there CC is hyperproliferation of reproductive tissue, e.g. uterine, testicular can dovarian carcinomas, endometriosis, squamous and glandular epithelial CC carcinomas of the cervix. Cell killing induced by Bok can be suppressed CC by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok CC protein can be used to elucidate apoptosis mechanisms in reproductive and CC other tissues, and provide a means for manipulating apoptosis. The Bok CC protein and transgenic animal are also useful for identifying ligands or CC substrates Modulation of the gene activity in vivo is useful for CC prophylaxis and therapy of, e.g. cancer and other proliferative CC disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein con with wide tissue distribution and heterodimerisation properties con call titates elucidation of apoptosis mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B
                                                                                                                                                                                                                                                              Q
                                                                                                                                                                                                                                                                                                                                                           Ъ
                                                                                                                                                                                                                                                                                                                                                                                     Q
                                                                                                                                                                                                                                                                                                                                                                                                                         망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a mammalian Bok (BCl-2-related ovarian killer)
CC protein, of the invention. Coding sequences for Bok or BH3i variants of
CC protein, of the invention. Coding sequences for Bok or BH3i variants of
CC pro-apoptotic Bok-related protein can be introduced into cell populations
CC to upregulate expression of the proteins in order to induce apoptosis in
CC the cell population. This is useful for treatment of diseases where there
CC is hyperproliferation of reproductive tissue, e.g. uterine, testicular
CC arcinomas of the cervix. Cell killing induced by Bok can be suppressed
CC orexpression with selective anti-apoptotic Bcl-2 proteins: The Bok
CC protein can be used to elucidate apoptosis mechanisms in reproductive and
CC other tissues, and provide a means for manipulating apoptosis. The Bok
CC protein and transgenic animal are also useful for identifying ligands or
CC substrates. Modulation of the gene activity in vivo is useful for
CC prophylaxis and therapy of, e.g. cancer and other proliferative
CC disorders. Bok genes are also useful for identification of cell type
CC based on expression. Identification of Bok as a new pro-apoptotic protein
CC substrates distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Loc

The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antithropid; antibacterial; antiviral; antifungal; antirheumatic; antithropid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                          The invention provides nucleic acid molecules (NAM1) encoding 4 human CC BC1-2-like polypeptides (PEP1). The NAM1 and PEP1 may be used in the CC prevention, diagnosis and treatment of diseases associated with CC inappropriate BC1-2-like polypeptides' expression. The NAM1 may be used CC to produce the soluble BC1-2-like polypeptides by standard recombinant CC methodolgy. The polypeptides may also be used as antigens in the CC modulators of BC1-2 expression and activity. The anti-BC1-2 antibodies against BC1-2 and in assays to identify CC modulators of BC1-2 expression and activity. The anti-BC1-2 antibodies CC and antagonists may be used to down regulate expression and activity. CC The anti-PEP1 antibodies may also be used as diagnostic agents for CC immunosorbant assay (ELISA). Disorders that may be prevented, diagnosed CC and/or treated by the above methods include, immunodeficiencies (e.g. captions, inflammations, resolvators and Grave's disease), altergic CC reactions, inflammations, resolvators and Grave's disease), altergic CC creactions, inflammations.
                                                                                                                                                                                                                                                                                                                                                                      Claim 12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Дb
                     antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthitis and ulcerative colitis, cardiovascular disorders such as
                                                                                                                                                                                                                                                                                                                                  invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic;
                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the isolation and characterisation of the DNA and protein sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; breast cancer; ovarian cancer; cytostatic; immunosuppressive; nootropic; neurpprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; immune disorder; antibacterial; antifungal; antiparasitic; cardiant; immune disorder;

                                                               capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                            increased apoptosis inhibitory activity compared with the wild type BC1-2 protein. The mutated BC1-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence is a mutant BC1-2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has

The protein has increased apoptosis inhibitory activity compared with the wild type Bc1-2 protein. The mutated Bc1-2 protein is useful in the treatment

Antisense oligonucleotides have been designed to bind sites in mRNA transcribed from the bcl-2 gene, thereby reducing expression of the bcl-2 protein and inducing cell death in certain cancer cells.

88888888888	CCCCCCR44888888888	2	RESU BCL12 PC PC PC DT DT DT DT DT OS OS OS
	SEQUENCE OF 19-172 FROM N.A.  Castren E., Ohga Y., Berzaghi M.P., Tzimagiorgis G., Thoenen H.,  Lindholm D.;  "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain.";  "bcl-2 messenger RNA is localized in neurons of the developing and adult rat brain.";  Neurosclence 61:165-177(1994).  -1- FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1).	SEQUENCE FROM N.A.  SEQUENCE FROM N.A.  TISSUE-Brain;  MEDLINE-94193015; PubMed-8144041;  Sato T., Irie S., Krajewski S., Reed J.C.;  "Cloning and sequencing of a cDNA encoding the rat Bcl-2 protein.";  Gene 140:291-292(1994). Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bcl2 appears to be phosphorylated by other protections such as ERKs and stress-activated kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       brain, expression is higher and in the cortical plate. European Bioinformatics Institute.
                                                                                                                                                                                                                                                                                                                                                                                              similarity).

DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity).

PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum (By interaction).
                                                                                                                                                                                                                                                                                                           similarity)
                                                                                                                                                                                                                                                                                                                        occurs during the 62/M phase of the cell cycle (By similarity). the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases. Dephosphorylated by protein phosphatase 2A (PP2A) (By

POTENTIAL.

CLEAVAGE (BY CASPASE-3 AND CASPASE-9).

PHOSPHORYLATION (BY PKC) (BY SIMILARITY).

```
the apoptosis - activating factor (APAF-1) (By similarity).

SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and BC1-x(L). Heterodimerslation with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity).

SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum.

DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity).

PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle (By similarity). In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases (By similarity). Dephosphorylated by protein phosphatase 2A (PP2A)

PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the B44 domain, has pro-apoptosic activity, courses the release of cytochrome c into the cytosol promoting further caspase activity.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.

SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1. SUBCELLULAR LOCATION: Outer mitcochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum. ALTERNATIVE PRODUCTS: 2 isoforms; alpha (shown here) and beta;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PTM: Proteolytically cleaved by caspases during apoptosis cleaved protein, lacking the BH4 domain, has pro-apoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Dephosphorylated by protein phosphatase 2A (PP2A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 occurs during the G2/M phase of the cell cycle. In the growth factors, Bcl2 appears to be phosphorylated by kinases such as ERKs and stress-activated kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                are produced by alternative splicing. TISSUE SPECIFICITY: Expressed in a va
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: Forms homodimers, and heterodimers with Bcl-x(L). Heterodimerization with BAX requires in domains, and is necessary for anti-apoptotic act.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 activity, causes the release of cytochrome c into the
